

Will the blinds provide full shading?

There are internal and external blinds which allow precise control of light. With them you can limit the access of light without completely stopping it. Such blinds are the slat interior blinds (vertical or venetian), roller Zebra (made of alternating strips of fabric – thick or plain, and by overlapping them you can control the amount of penetrating light) and the external venetian blinds.

Roller blinds with screen fabrics are suitable for shading offices and other rooms which are used during the day. The fabric lets the daylight in so you do not have to spend your day under artificial light – something that besides being unpleasant also increases the costs for electricity and simultaneously stops the annoying glares reflected on the monitor.

Full shading can be achieved with interior textile blinds made of Black Out material (vertical, roller, plisse), aluminum venetian blinds Black Out or exterior blinds – roller or venetian.
